Slope

Well look, this is the slope of the line in green. That's the slope of the line. And I can put the two points in. If the point a, b is on this line, I'll have the slope times x minus a is equal to y minus b .

Now, let's see why this is useful or why people like to use this type of thing. Let's not use just a, b and a slope of m anymore.

First, you should plug the given points, $(5, -8)$ $(-2, 6)$, into the slope formula to find the slope of the line. Then, plug the slope into the slope formula, $y = mx + b$, where m is the slope. $y = -2x + b$. Plug in either one of the given points, $(5, -8)$ or $(-2, 6)$, into the equation to find the y -

intercept (b). $6 =$

$$-2(-2) + b. 6 = 4 + b.$$

$$2 = b$$

**Slope and Line
Equations - Algebra
1 - Varsity Tutors**

What About $y = mx + b$? You may already be familiar with the

" $y=mx+b$ " form (called the slope-intercept form of the equation of a line). It is the same equation, in a different form! The "b" value (called the y-intercept)

practice)

So let's first think about point-slope form. Point, point-slope form. And point-slope form is very easy to generate if you know a point on the line, or if you know a point that satisfies, where the X and Y coordinates satisfy the linear equation, and if you were to know the slope of the line that represents the solution set of that linear equation.
