Colloidal silicas are most often prepared in a multi-step process where an alkali-silicate solution is partially neutralized, leading to the formation of silica nuclei. The subunits of colloidal silica particles are typically in the range of 1 to 5 nm. Whether or not these subunits are joined together depends on the conditions of polymerization.

Un colloïde est une suspension d'une ou plusieurs substances dispersées régulièrement dans un liquide, formant un système à deux phases séparées. Il s'agit d'une dispersion homogène (à grande échelle) de particules dont les dimensions vont du nanomètre au micromètre [1]. Ces particules ont donc la taille d'une nanoparticule, même si elles ne sont pas spécifiquement considérées ...
